

Types of Fires/Oven/Stoves

Altar fires should be encouraged rather than pit or trench fires as they cause less damage to the ground. Basically, an altar fire is a fire built on a platform. Platforms can be built in a number of ways either by logs, a frame, or bricks and stones. The key to any altar fire is firstly to build a big enough platform, secondly to build it at a comfortable and safe height and lastly and perhaps most importantly to have a sufficiently thick base of mud on top of the platform on which your fire is to be built to prevent the fire burning through the fire base.

Types of Camp Oven
